

Test Summary Report

Project Information

Project	OpenCart Website — Registration, Login & Account Details
Application Under Test	https://www.opencart.com/ (live)
Testing Type	Manual
Testing Period	13–16 July 2026
Tester	Gohar Zaman (QA)
Reference	Test_Plan-OpenCart_v1.1.docx

1. Objective

This cycle set out to verify the three account-related modules of the OpenCart website against the plan agreed in v1.1: that new users can register (including the confirmation email), that authentication and password recovery behave correctly end to end, and that account details can be viewed and maintained safely. All planned cases were executed manually and tracked in TestRail; this report consolidates the outcome, the defects raised, and a release view.

2. Scope

Modules covered in this cycle:

- Registration — sign-up form, validations, duplicate handling, confirmation email
- Login — authentication, password recovery via email, session handling, logout
- Account Details — profile view/edit, email change, password change, newsletter, account-page protection

Out of Scope

- Marketplace, forum, blog, documentation, demo store, support tickets and OpenCart Cloud flows
- Load, stress and formal penetration testing (injection-style negative checks on the in-scope forms were executed)
- Mail-server concerns such as spam scoring and cross-provider deliverability; functional email verification to the monitored test inbox was in scope and executed

3. Test Environment

Item	Details
Environment	Production (live public site)
Browsers	Chrome (primary); Firefox, Edge, Safari (sanity)
Operating System	Windows 11; responsive checks at mobile/tablet/desktop widths
Email Verification	Monitored test mailboxes with full inbox access

Test Management Tool	TestRail
----------------------	----------

4. Test Execution Summary

Metric	Count
Total Test Cases	92
Executed	92
Passed	81
Failed	11
Blocked	0
Not Executed	0
Execution Completion	100%
Pass Rate	88%

By module:

Module	Executed	Passed	Failed
Registration	30	28	2
Login	31	26	5
Account Details	31	27	4
Total	92	81	11

5. Defect Summary

Severity	Count
Critical	2
High	2
Medium	4
Low	3
Total Defects	11

All 11 defects are logged in the accompanying bug report (BUG-OC-001 to BUG-OC-011) with reproduction steps, severity, priority and environment. Every failed TestRail case maps to exactly one logged defect.

6. Major Findings

The most significant issues found in this cycle:

- **Logout does not fully end the session** — after logging out, the browser Back button restores the authenticated account view (Critical).
- **No password strength enforcement at registration** — all-lowercase and all-digit passwords are accepted with no composition rules or guidance (Critical).
- **The previous password still works after a password change** — both old and new passwords authenticate (High).
- **Changing the password does not invalidate other active sessions** — a session in another browser remains fully usable (High).
- **The forgotten-password page discloses account existence** — responses differ for registered vs unregistered addresses, enabling account enumeration (Medium).
- **Session state is inconsistent within the same browser** — sign-in does not carry across tabs/windows reliably, and logout in one tab is not reflected in another (Medium).
- **PIN length is not validated** — the PIN field accepts more than the required 4 digits (Medium).
- **Missing account-security notifications** — no email is sent when the account email or password is changed (Low, defence-in-depth gap).

7. Risks and Limitations

- Testing ran against the live production site; test data was confined to disposable accounts created by QA, and no destructive scenarios were exercised.
- Performance and load behaviour were not assessed in this cycle.
- The injection and session checks are functional negative tests, not a substitute for a formal security assessment — several session-related failures above suggest one is warranted.
- No requirements specification existed; expected behaviour was based on standard account-management conventions, and ambiguous outcomes were logged as observations.

8. Overall Assessment

All 92 planned test cases were executed (100% completion) with a pass rate of **88%**.

Core user journeys work: account creation with its confirmation email, sign-in, end-to-end password recovery through the emailed link, profile and password maintenance, and cross-browser/responsive behaviour all passed. The failures cluster around session lifecycle and account-security hardening — logout/back-button exposure, password-change hygiene, account enumeration and missing security notifications — which are exactly the areas a production account system should have airtight.

9. Recommendation

Release Status: Conditionally Ready

The account modules are functionally usable, but release should be gated on:

- Resolution of both Critical defects (session persistence after logout; absent password rules) and the two High defects (old password accepted after change; other sessions not invalidated).
- Retest of all 11 failed cases plus a regression pass over the session and password-recovery suites.

- A decision on the Medium enumeration finding and the missing security-notification emails, which are recommended fixes even if not release-blocking.

10. Deliverables

- Test Plan (Test_Plan-OpenCart_v1.1.docx)
- Test Cases — TestRail project and Excel workbook
- Test Execution Report exported from TestRail (Test Run 16 July 2026)
- Bug Report (BUG-OC-001 to BUG-OC-011)
- This Test Summary Report
